

Abstract of the Disclosure:

A device for locking a first housing part and a second housing part to one another includes a locking element inserted into an opening in the first housing part. The locking element is configured to be movable between a locking position and an unlocking position. The locking element, if in the locking position, connects the first housing part to the second housing part in a form-locking and/or a force-locking manner. The locking element, if in the unlocking position, releases a connection between the first housing part and the second housing part. A blocking element is connected to the locking element for blocking the locking element from being adjusted at least in the locking position. A multi-part housing is also provided.
